

# St. Anna (Stearns County)

## OVERVIEW

St. Anna Lake is a lightly developed natural environment lake located five miles east of St. Rosa in northern Stearns County. A survey conducted in 2015 was designed to monitor changes in the fishery which may have occurred over the past nine years since the last survey was done. Land use in the watershed is predominantly agricultural which has had an effect on the water quality and non point pollution has caused Tullibee to disappear. The water clarity in St. Anna Lake averages about 10 feet over the summer. Based on the 2006 aquatic plant survey, northern watermilfoil and coontail were the most common species of submergent vegetation and grew to a depth of 10 feet. The lake has very little fishing structure other than along weedlines and steep drop offs. Public access is available at the state owned access located on the northwest side of the lake. Removing cattle from the immediate shoreline and better agricultural practices within the watershed are encouraged to improve water quality in St. Anna Lake.
